

What is an internet domain name? A domain name is a string of text that maps to an alpha numeric IP address or the web address used to identify a website.

Why are domain names so important on the web? They simplify the IP addresses of websites to something understandable and memorable as an identity for a website.

Why do domain names have to be unique? When you register a domain name it gives you unique ownership to the website. A unique name gives your website a unique address, similar to a street address.

What does it mean to "register" a domain name? This is the act of purchasing or reserving the rights to a domain name for a period, usually a year.

If you wanted a domain name that is already taken, how could you get it? You check to see who has the right to the name. If it is a hosting company, you could purchase it at auction. If it is an individual or company, you can request to purchase it directly from the private party.

Registrar Companies and Pricing
