

Web Hosting Report

1. What is a web server? Why would you need one?

A web server is a software that responds to client requests, and stores the data for a website through the world wide web. It would be needed to store and display website content so that your website is legible(Awati & Smith, 2024).

2. Explain why getting a domain name is not enough to put your site up on the web.

While a domain name creates an address for your website, web hosting creates a space to store all the data and images to be displayed by your website (Schäferhoff, 2025).

3. What service does a website hosting company provide?

It provides server space and infrastructure for your site as well as making it accessible via search engines.

4. What are the most important characteristics to look for in selecting a good web hosting company?

Storage space, cost, traffic limits, and database support

5. Research companies that provide website hosting plans. On average, what is the price range (price per month) for hosting a website?

\$4.25

6. What are the most important features for you when reviewing a hosting plan?

It's important to note if the company provides privacy protection, email account service, the size of data storage available, maintenance and assistance, bandwidth or traffic limits, and the cost associated with these services.

	<u>GoDaddy.com</u>	Hostinger	Bluehost
Domain registration costs	Free	Free 1 year	Free/ \$15
Database support	mySQL, MSQL	MariaDB	mySQL, PostgreSQL
Website traffic limitations	Unlimited	Unlimited	40k/month
Server storage space	10 GB	20 GB	10GB
Cost per month	5.99	3.99	3.99

Hostinger seems the best value comparing cost per month with space and traffic limits. Though the database support is different from standard, the company claims it is compatible with MySQL.
