

Search Engine Ranking Report

1. Research Questions

A. How does a search engine work?

Search engines use a software known as web crawlers to gather and build an index of webpages. Placement in this index is determined through keywords, traffic analytics and meta tags included in web pages headers and titles. These are sorted and delivered to the searcher through an algorithm

B. Why do different search engines give different ranking to websites for the same search phrase?

Different search engines use different algorithms to determine relevance. Web crawlers collect information from the websites as well as your location, interests, gender, age, even your phone number. These factors are part of the mathematical equation written for each independent search engines, yielding different results for the same search phrase. There are also sponsored results that will always have a higher priority since those sites have paid to secure those top spaces.

C. What is a meta tag? What is the purpose for Keywords and Description meta tags?

A meta tag is a snippet of HTML code that describes the website content. They exist within the head of a page.

Keywords and descriptions meta tags help to grab attention and let the search engines know what content is contained in each webpage. Keywords are allegedly obsolete, while descriptions are still used as an attention grabber.

D. Why might you include meta tags in your pages? Do meta tags make your pages more easily searchable or improve its ranking?

You would use meta tags to communicate directly with search engines. Interacting with this software helps your site rank higher in SEO and come up in more searches.

E. What are several ways that you can publicize a website project and make it more visible on the web?

Optimize for search results, sharing it across social platforms, joining business directories, paying for promotion, or register directly with a search engine.

2. Complete the following table of information from your three comparable websites.
